

How to move rules from one computer to another

To move your rules from one computer to another, follow these steps:

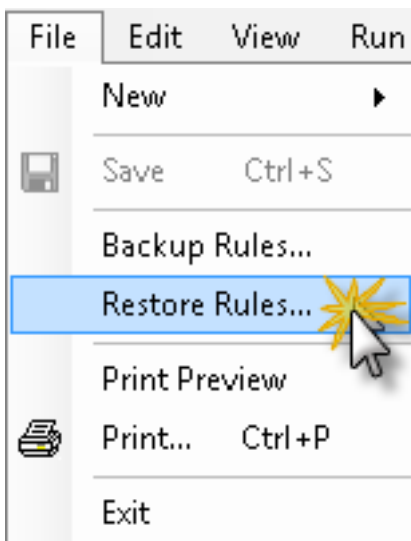

Open the Rule Manager (first Auto-Mate toolbar icon)

Then select **File->Backup Rules**

Select a location on your hard drive, and save the resulting .db3 file.

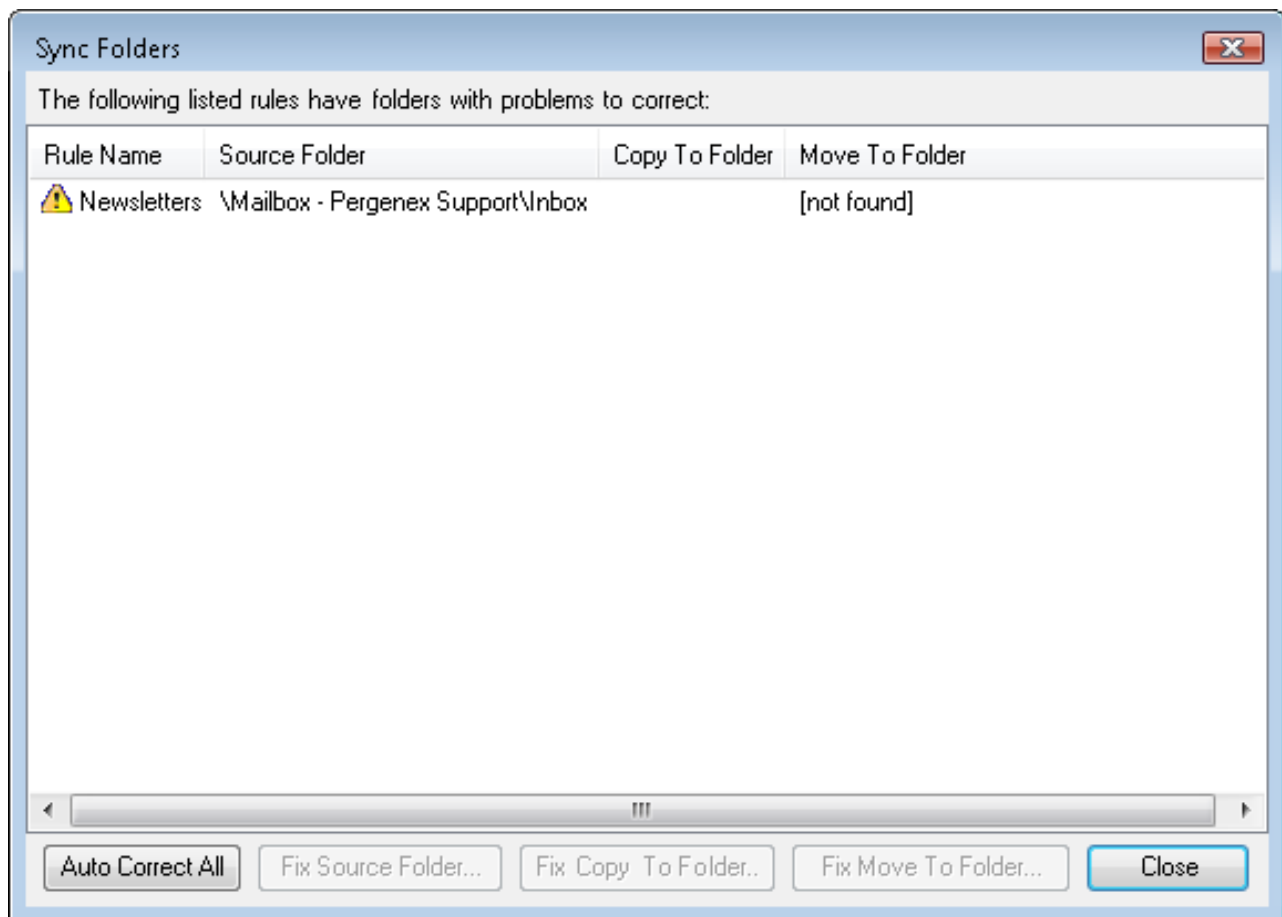

After moving the file to another computer, Open the Rule Manager and select **File->Restore Rules**:

Important Note:

If your rules were created against folders in a Microsoft Exchange Store, they will move from computer to computer without any intervention. If your rules were created against PST folders, the folders on the destination computer may not be recognized. The folder id's used to identify the folders will be different. To re-synchronize the folders, you can use Auto-Mate's Sync Folders feature:

From the Auto-Mate Rule Manager, select **Tools->Sync Folders**:

You can use the **Auto Correct All** button to resync the folders. If the destination folder does not exist, it will create it for you automatically. You can also select each rule that is in error and correct the folders manually.
